ThinkHub Supports One Click for Everything, not just ClickShare

ThinkHub is the solution that solves many visual collaboration requirements, providing true equity of participation so that multiple people, in multiple locations (or just the same room), can simultaneously share multiple pieces of content. The best innovation spaces need this level of collaboration where these different sources of information can be seen in a single visual panorama.

Having content gathered in a wider view allows connections with contextual information to be made, new perspectives to be identified, and fresh interpretations to be reached. If you need to 'zoom in' on any particular issue, One Click in ThinkHub isolates and magnifies that single piece of content. In many ways, ThinkHub is the perfect digital replacement for traditional analogue project rooms where so many great products and services were developed.

Using its own App, ThinkHub supports multiple simultaneous connections that can't always be achieved in alternative browser-based solutions. But ThinkHub also supports the physical wired connection of many appliances, such as medical equipment, 3DScanners, and yes, ClickShare, enabling these sources to sit alongside and add value to the other content on your canvas, instead of replacing them on your display.

Let ThinkHub Control Your Life!

Many installations have ThinkHub as the primary source, with the ability to switch to ClickShare or a Laptop instead. Most organisations use a control system with an in-room control panel to select their choice of content from.

But there's another way, a better way, that eliminates the either / or choice and lets you have the added ►

power to collaboration, communication, and innovation of all three information sources together, or just one at a time if that's what you still want.

Instead of routing ClickShare and Laptops into different HDMI ports on your display, route them directly into ThinkHub instead as HDMI inputs with USB for their touch control.

From the ThinkHub canvas, those additional content sources, such as ClickShare, Laptops, etc., will each be seen as a permanent thumbnail image in the ThinkHub taskbar. Simply tap the thumbnail and that source comes onto screen as its own window of available content in ThinkHub. You can resize the ClickShare window if you want to see the ClickShare content alongside other content that prompted you to add this information. Or, with another single click, you can make the ClickShare window full screen and just concentrate on that content.

Share anything or everything on your MS Teams call
ThinkHub has a client for MS Teams, Zoom, Webex and Google Meet, allowing you to integrate your video calls

into ThinkHub and for your content in ThinkHub to be shared on whichever platform(s) you use.

This way, if you're using ThinkHub within a VC call, you can add ClickShare content to the existing call, and not have to change the input to ClickShare and reinitiate a VC call.

The simultaneous sharing of information is far more powerful to innovation and collaboration than the 'to me, to you' switching within VC platforms, and there's far more you can achieve with sharing ClickShare within T1V's ThinkHub than just ClickShare itself. ■
